

Better Browse Features

Better Browse Features is a tool that allows users to navigate through a selection of features one at a time. This tool improves on Data Reviewer's Browse Features in the following ways:

- Pans to each feature instead of zooms
- Allows manual input of a number to seek to
- Consistently orders features from session to session
- Does not require the Data Reviewer extension
- Does not stop working when ImageConnect metadata layers are present in the MXD

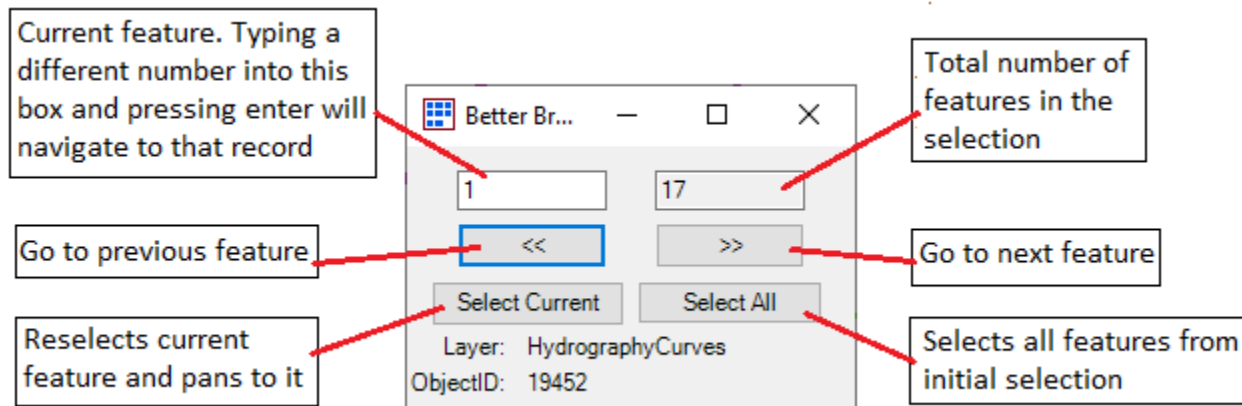

User Instructions

Add the tool to the ArcMap interface:

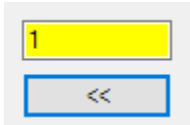

- Click Customize > Customize Mode. Click the Commands Tab.
- In the column on the left, click the Add-In Controls category.
- In the column on the right, drag and drop the Better Browse Features tool onto any toolbar.

Step 1: Select any number of features.

Step 2: Click the Better Browse Features button  and the tool window will open.

-If the feature associated with a record was not found, the left text box will become yellow when it is browsed to.

Please contact me with any questions, feedback, or bugs encountered.
