

Spot Generator

Spot Generator streamlines the process of adding spot heights to transportation and river intersections in cartographic products. It is compatible with feature-linked and non-feature-linked annotation.

Step 1: Install Spot Generator by double-clicking the add-in file in Windows Explorer and choosing Install Add-In from the pop-up.

Step 2: Open a cartography template in ArcMap with HypsographyPoints and a DEM layer loaded in.

Step 3: If necessary, add the Spot Generator tool to the interface. This can be done by going to Customize > Customize Mode > click the Commands tab > Navigate to the Spot Generator category > Drag the Spot Generator button into any toolbar

Step 4: Start an editing session and click the Spot Generator tool to enable it 

Step 5: Click a location. A suppressed spot height and annotation will be created. The active tool then automatically switches to the Edit tool for adjusting the annotation.
